# How to Use This Guide

This manual is designed to help you use/understand the DAQ/PXI-20XX. The manual describes the versatile functions and the operation theory of the DAQ/PXI-20XX. It is divided into five chapters:

- Chapter 1,** Introduction gives an overview of the product features, applications, and specifications.
- Chapter 2,** Installation describes how to install the DAQ/PXI-20XX. The layout of DAQ/PXI-20XX, including the positions of connectors, the connectors' pin assignments are specified.
- Chapter 3,** Signal Connections describes the connector of the DAQ/PXI-20XX, and the signal connection between the DAQ/PXI-20XX and external devices. The layout of DAQ/PXI-20XX, including the positions of connectors, the connectors' pin assignments are also specified.
- Chapter 4,** Operation Theory describes how to operate DAQ/PXI-20XX. The A/D, D/A, GPIO, timer/counter, trigger and timing signal routing are introduced.
- Chapter 5,** Calibration describes how to calibrate the DAQ/PXI-20XX for accurate measurements.

# 1

## Introduction

The DAQ/PXI-20XX is an advanced data acquisition card based on the 32-bit PCI architecture. High performance designs and the state-of-the-art technology make this card ideal for data logging and signal analysis applications in medical, process control, etc.

---

### 1.1 Features

The DAQ/PXI-20XX Advanced Data Acquisition Card provides the following advanced features:

- 32-bit PCI-Bus, plug and play
- 4-channel simultaneous differential analog inputs
- DAQ/PXI-2010: 14-bit Analog input resolution with sampling rate up to 2MS/s
- DAQ/PXI-2005: 16-bit Analog input resolution with sampling rate up to 500KS/s
- DAQ/PXI-2006: 16-bit Analog input resolution with sampling rate up to 250KS/s
- Programmable bipolar/unipolar analog input
- Programmable gain (x1, x2, x4, x8 for all DQ-20XX)
- DAQ/PXI-2010: Total 8K samples A/D FIFO
- DAQ/PXI-2005/2006: Total 512 samples A/D FIFO

- Versatile trigger sources: software trigger, external digital trigger, analog trigger and trigger from System Synchronization Interface (SSI).
- A/D Data transfer: software polling & bus-mastering DMA with Scatter/Gather functionality
- Four A/D trigger modes: post-trigger, delay-trigger, pre-trigger and middle-trigger
- 2 channel DA outputs with waveform generation capability
- 2K samples output data FIFO for DA channels
- DA Data transfer: software update and bus-mastering DMA with Scatter/Gather functionality
- System Synchronization Interface (SSI)
- A/D/DA fully auto-calibration
- Completely jumper-less and software configurable

---

## 1.2 Applications

- Automotive Testing
- Cable Testing
- Transient signal measurement
- ATE
- Laboratory Automation
- Biotech measurement

---

## 1.3 Specifications

### ◆ Analog Input (AI)

- **Number of channels:** 4 differential
- **A/D converter:**
  - 2010: LTC1414 or equivalent
  - 2005: A/D7665 or equivalent
  - 2006: A/D7663 or equivalent
- **Max sampling rate:**
  - 2010: 2MS/s
  - 2005: 500kS/s
  - 2006: 250kS/s
- **Resolution:**
  - 2010: 14 bits, no missing code
  - 2005/2006: 16 bits, no missing code
- **FIFO buffer size:**
  - 2010: 8K samples
  - 2005/2006: 512 samples
- **Programmable input range:**
  - Bipolar:  $\pm 10V$ ,  $\pm 5V$ ,  $\pm 2.5V$ ,  $\pm 1.25V$
  - Unipolar:  $0\sim 10V$ ,  $0\sim 5V$ ,  $0\sim 2.5V$ ,  $0\sim 1.25V$
- **Operational common mode voltage range:**  $\pm 11V$
- **Overvoltage protection:**
  - Power on: continuous  $\pm 30V$
  - Power off: continuous  $\pm 15V$
- **Input impedance:**  $1G\Omega/100pF$

- **-3dB small signal bandwidth: (Typical, 25° C)**

Device	Input Range	Bandwidth (-3dB)	Input Range	Bandwidth (-3dB)
2010	±10V	1170 kHz	0~10V	1090 kHz
	±5V	1050 kHz	0~5V	1020 kHz
	±2.5V	800 kHz	0~2.5V	790 kHz
	±1.25V	530 kHz	0~1.25V	530 kHz
2005	±10V	1160 kHz	0~10V	1210 kHz
	±5V	1050 kHz	0~5V	1050 kHz
	±2.5V	780 kHz	0~2.5V	770 kHz
	±1.25V	520 kHz	0~1.25V	530 kHz
2006	±10V	630 kHz	0~10V	640 kHz
	±5V	620 kHz	0~5V	620 kHz
	±2.5V	540 kHz	0~2.5V	540 kHz
	±1.25V	410 kHz	0~1.25V	420 kHz

**Table 1: -3dB small signal bandwidth**

- **System Noise: (Typical)**

Device	Input Range	System noise	Input Range	System noise
2010	±10V	0.6 LSBrms	0~10V	0.8 LSBrms
	±5V	0.6 LSBrms	0~5V	0.8 LSBrms
	±2.5V	0.6 LSBrms	0~2.5V	0.9 LSBrms
	±1.25V	0.6 LSBrms	0~1.25V	0.9 LSBrms
2005	±10V	1.2 LSBrms	0~10V	1.9 LSBrms
	±5V	1.2 LSBrms	0~5V	2.0 LSBrms
	±2.5V	1.3 LSBrms	0~2.5V	2.1 LSBrms
	±1.25V	1.3 LSBrms	0~1.25V	2.2 LSBrms
2006	±10V	1.0 LSBrms	0~10V	1.5 LSBrms
	±5V	1.0 LSBrms	0~5V	1.6 LSBrms
	±2.5V	1.1 LSBrms	0~2.5V	1.7 LSBrms
	±1.25V	1.1 LSBrms	0~1.25V	1.8 LSBrms

**Table 2: System Noise**

- **CMRR:** (DC to 60Hz, Typical)

Device	Input Range	CMRR	Input Range	CMRR
2010	±10V	90 dB	0~10V	89 dB
	±5V	92 dB	0~5V	92 dB
	±2.5V	95 dB	0~2.5V	94 dB
	±1.25V	97 dB	0~1.25V	97 dB
2005	±10V	86 dB	0~10V	85 dB
	±5V	88 dB	0~5V	88 dB
	±2.5V	91 dB	0~2.5V	90 dB
	±1.25V	93 dB	0~1.25V	93 dB
2006	±10V	87 dB	0~10V	86 dB
	±5V	89 dB	0~5V	88 dB
	±2.5V	91 dB	0~2.5V	91 dB
	±1.25V	93 dB	0~1.25V	93 dB

**Table 3: CMRR: (DC to 60Hz)**

- **Time-base source:**  
Internal 40MHz or External clock Input (fmax: 40MHz, fmin: 1MHz, 50% duty cycle)
- **Trigger modes:**  
Post-trigger, Delay-trigger, Pre-trigger and Middle-trigger
- **Data transfers:**  
Programmed I/O, and bus-mastering DMA with scatter/gather
- **Input coupling:** DC
- **Offset error:**  
Before calibration: ±60mV max  
After calibration: ±1mV max
- **Gain error:**  
Before calibration: ±0.6% of output max  
After calibration: ±0.1% of output max for DAQ/PXI-2010  
±0.03% of output max for DAQ/PXI-2005/2006

#### ◆ Analog Output (AO)

- **Number of channels:** 2 channel voltage output
- **DA converter:** LTC7545 or equivalent
- **Max update rate:** 1MS/s
- **Resolution:** 12 bits
- **FIFO buffer size:**  
1k samples per channel when both channels are enabled for timed DA output, and 2k samples when only one channel is used for timed DA output
- **Data transfers:**  
Programmed I/O, and bus-mastering DMA with scatter/gather
- **Output range:**  
Bipolar:  $\pm 10V$  or  $\pm AOEXTREF$   
Unipolar:  $0\sim 10V$  or  $0\sim AOEXTREF$
- **Settling time:**  $3\mu S$  to 0.5 LSB accuracy
- **Slew rate:**  $20V/\mu S$
- **Output coupling:** DC
- **Protection:** Short-circuit to ground
- **Output impedance:**  $0.1\Omega$  max.
- **Output driving current:**  $\pm 5mA$  max.
- **Stability:** Any passive load, up to  $1500pF$
- **Power-on state:**  $0V$  steady-state
- **Power-on glitch:**  $\pm 1.5V/500\mu S$
- **Offset error:**  
Before calibration:  $\pm 80mV$  max  
After calibration:  $\pm 1mV$  max
- **Gain error:**  
Before calibration:  $\pm 0.8\%$  of output max  
After calibration:  $\pm 0.02\%$  of output max

◆ **General Purpose Digital I/O (G.P. DIO, 82C55A)**

- **Number of channels:** 24 programmable Input/Output
- **Compatibility:** TTL/CMOS
- **Input voltage:**  
Logic Low:  $V_{IL}=0.8V$  max;  $I_{IL}=0.2mA$  max.  
High:  $V_{IH}=2.0V$  max;  $I_{IH}=0.02mA$  max
- **Output voltage:**  
Low:  $V_{OL}=0.5V$  max;  $I_{OL}=8mA$  max.  
High:  $V_{OH}=2.7V$  min;  $I_{OH}=400\mu A$
- **Synchronous Digital Inputs (SDI, for DAQ/PXI-2010 only)**
- **Number of channels:** 8 digital inputs sampled simultaneously with the analog signal input
- **Compatibility:** TTL/CMOS
- **Input voltage:**  
Logic Low:  $V_{IL}=0.8V$  max;  $I_{IL}=0.2mA$  max.  
Logic High:  $V_{IH}=2.7V$  min;  $I_{IH}=0.02mA$  max.

◆ **General Purpose Timer/Counter (GPTC)**

- **Number of channel:** 2 Up/Down Timer/Counters
- **Resolution:** 16 bits
- **Compatibility:** TTL
- **Clock source:** Internal or external
- **Max source frequency:** 10MHz

◆ **Analog Trigger (A.Trig)**

- **Source:**  
All analog input channels; external analog trigger (EXTATRIG)
- **Level:**  $\pm$ Full-scale, internal;  $\pm 10V$  external
- **Resolution:** 8 bits
- **Slope:** Positive or negative (software selectable)
- **Hysteresis:** Programmable
- **Bandwidth:** 400khz

- ◆ **External Analog Trigger Input (EXTATRIG)**
  - **Input Impedance:**  
40k $\Omega$  for DAQ/PXI-2010  
2k $\Omega$  for DAQ/PXI-2005/2006
  - **Coupling:** DC
  - **Protection:** Continuous  $\pm 35V$  maximum
- ◆ **Digital Trigger (D.Trig)**
  - **Compatibility:** TTL/CMOS
  - **Response:** Rising or falling edge
  - **Pulse Width:** 10ns min
- ◆ **System Synchronous Interface (SSI)**
  - **Trigger lines:** 7
- ◆ **Stability**
  - **Recommended warm-up time:** 15 minutes
  - **On-board calibration reference:**  
Level: 5.000V  
Temperature coefficient:  $\pm 2\text{ppm}/^{\circ}\text{C}$   
Long-term stability: 6ppm/1000Hr
- ◆ **Physical**
  - **Dimension:** 175mm by 107mm
  - **I/O connector:** 68-pin female VHDCI type (e.g. AMP-787254-1)
- ◆ **Power Requirement (typical)**
  - **+5VDC:** 1.82 A for DAQ/PXI-2010  
2.04 A for DAQ/PXI-2005  
1.82 A for DAQ/PXI-2006
- ◆ **Operating Environment**
  - **Ambient temperature:** 0 to 55 $^{\circ}\text{C}$
  - **Relative humidity:** 10% to 90% non-condensing

◆ **Storage Environment**

- **Ambient temperature:** -20 to 80°C
- **Relative humidity:** 5% to 95% non-condensing

◆ **Interface Connector:** 68-pin AMP-787254-1 or equivalent

---

## 1.4 Software Support

ADLINK provides versatile software drivers and packages for users' different approach to building up a system. ADLINK not only provides programming libraries such as DLL for most Windows based systems, but also provide drivers for other software packages such as LabVIEW<sup>®</sup>.

All software options are included in the ADLINK CD. Non-free software drivers are protected with licensing codes. Without the software code, you can install and run the demo version for two hours for trial/demonstration purposes. Please contact ADLINK dealers to purchase the formal license.

### 1.4.1 Programming Library

For customers who are writing their own programs, we provide function libraries for many different operating systems, including:

- **D2K-DASK:** Include device drivers and DLL for **Windows 98**, **Windows NT** and **Windows 2000**. DLL is binary compatible across Windows 98, Windows NT and Windows 2000. This means all applications developed with D2K-DASK are compatible across Windows 98, Windows NT and Windows 2000. The developing environment can be VB, VC++, Delphi, BC5, or any Windows programming language that allows calls to a DLL. The user's guide and function reference manual of D2K-DASK are in the CD. (\\Manual\_PDF\\Software\\D2K-DASK)
- **D2K-DASK/X:** Include device drivers and shared library for Linux. The developing environment can be Gnu C/C++ or any programming language that allows linking to a shared library. The user's guide and function reference manual of D2K-DASK/X are in the CD. (\\Manual\_PDF\\Software\\D2K-DASK-X.)

### 1.4.2 D2K-LVIEW: LabVIEW® Driver

D2K-LVIEW contains the VIs, which are used to interface with NI's LabVIEW® software package. The D2K-LVIEW supports Windows 98/NT/2000. The LabVIEW® drivers is shipped free with the card. You can install and use them without a license. For detailed information about D2K-LVIEW, please refer to the user's guide in the CD.

(\\Manual\_PDF\Software\D2K-LVIEW)

### 1.4.3 PCIS-OCX: ActiveX Controls

We suggest customers who are familiar with ActiveX controls and VB/VC++ programming use PCIS-OCX ActiveX control component libraries for developing applications. PCIS-OCX is designed for Windows 98/NT/2000. For more detailed information about PCIS-OCX, please refer to the user's guide in the CD.

(Manual\_PDF\Software\PCIS-OCX\PCIS-OCX.PDF)

The above software drivers are shipped with the card. Please refer to the "**Software Installation Guide**" in the package to install these drivers.

In addition, ADLINK supplies ActiveX control software *DAQBench*. *DAQBench* is a collection of ActiveX controls for measurement or automation applications. With *DAQBench*, you can easily develop custom user interfaces to display your data, analyze data you acquired or received from other sources, or integrate with popular applications or other data sources. For more detailed information about *DAQBench*, please refer to the user's guide in the CD.

(Manual\_PDF\Software\DAQBench\DAQBenchManual.PDF)

You can also get a free 4-hour evaluation version of *DAQBench* from the CD.

DAQBench is not free. Please contact ADLINK dealer or ADLINK to purchase the software license.

# 2

## Installation

This chapter describes how to install the DAQ/PXI-20XX. The contents of the package and unpacking information that you should be aware of are outlined first.

The DAQ/PXI-20XX performs an automatic configuration of the IRQ, and port address. Users can use software utility, PCI\_SCAN to read the system configuration.

---

### 2.1 Contents of Package

In addition to this *User's Guide*, the package should include the following items:

- DAQ/PXI-20XX Multi-function Data Acquisition Card
- ADLINK All-in-one Compact Disc
- Software Installation Guide

If any of these items are missing or damaged, contact the dealer from whom you purchased the product. Save the shipping materials and carton in case you want to ship or store the product in the future.

---

## 2.2 Unpacking

Your DAQ/PXI-20XX SERIES card contains electro-static sensitive components that can be easily be damaged by static electricity.

Therefore, the card should be handled on a grounded anti-static mat. The operator should be wearing an anti-static wristband, grounded at the same point as the anti-static mat.

Inspect the card module carton for obvious damages. Shipping and handling may cause damage to your module. Be sure there are no shipping and handling damages on the modules carton before continuing.

After opening the card module carton, extract the system module and place it only on a grounded anti-static surface with component side up.

Again, inspect the module for damages. Press down on all the socketed IC's to make sure that they are properly seated. Do this only with the module place on a firm flat surface.

*You are now ready to install your DAQ/PXI-20XX.*

---

**Note:** DO NOT APPLY POWER TO THE CARD IF IT HAS BEEN DAMAGED.

---

## 2.3 DAQ/PXI-20XX Layout

**Figure 1: PCB Layout of the DAQ-20XX**

**Figure 2: PCB Layout of the PXI-20XX**

---

## 2.4 PCI Configuration

### 1. Plug and Play:

As a plug and play component, the card requests an interrupt number via its PCI controller. The system BIOS responds with an interrupt assignment based on the card information and on known system parameters. These system parameters are determined by the installed drivers and the hardware load seen by the system.

### 2. Configuration:

The board configuration is done on a board-by-board basis for all PCI boards on your system. Because configuration is controlled by the system and software, there is no jumper setting required for base-address, DMA, and interrupt IRQ.

The configuration is subject to change with every boot of the system as new boards are added or removed.

### 3. Trouble shooting:

If your system doesn't boot or if you experience erratic operation with your PCI board in place, it's likely caused by an interrupt conflict (perhaps the BIOS Setup is incorrectly configured). In general, the solution, once you determine it is not a simple oversight, is to consult the BIOS documentation that comes with your system.

# 3

## Signal Connections

This chapter describes the connectors of the DAQ/PXI-20XX, and the signal connection between the DAQ/PXI-20XX and external devices.

---

### 3.1 Connectors Pin Assignment

The DAQ/PXI-20XX is equipped with one 68-pin VHDCI-type connector (AMP-787254-1). It is used for digital input/output, analog input / output, and timer/counter signals, etc. The pin assignments of the connectors are defined in Figure 3.

## 3.2 Analog Input Signal Connection

The DAQ/PXI-20XX provides 4 differential analog input channels. The analog signal can be converted to digital values by the A/D converter. To avoid ground loops and get more accurate measurements from the A/D conversion, it is quite important to understand the signal source type and how to connect the analog input signals.

### 3.2.1 Types of signal sources

#### *Ground-Referenced Signal Sources*

A ground-referenced signal means it is connected in some way to the building system. That is, the signal source is already connected to a common ground point with respect to the DAQ/PXI-20XX, assuming that the computer is plugged into the same power system. Non-isolated outputs of instruments and devices that plug into the buildings power system are ground-referenced signal sources.

#### *Floating Signal Sources*

A floating signal source means it is not connected in any way to the buildings ground system. A device with an isolated output is a floating signal source, such as optical isolator outputs, transformer outputs, and thermocouples.

### 3.2.2 Single-Ended Measurements

For single-ended connection, the analog input signal is referenced to the common ground of the system. In this case, all the negative ends of analog input channels should be connected to the AIGND on the connector instead of floating. Please refer to the figure 4.

Figure 4: Single-Ended connections

In single-ended configurations, more electrostatic and magnetic noise couples into the single connections than in differential configurations. Therefore, the single-ended connection is not recommended unless minimal wire connections are necessary.

### 3.2.3 Differential Measurements

#### *Differential Connection for Grounded-Reference Signal Sources*

The differential analog input provides two inputs that respond to the signal voltage difference between them. If the signal source is ground-referenced, the differential mode can be used for the common-mode noise rejection. Figure 5 shows the connection of ground-referenced signal sources under the differential input mode.

**Figure 5: Ground-referenced source and differential input**

### ***Differential Connection for Floating Signal Sources***

Figure 6 shows how to connect a floating signal source to DAQ/PXI-20XX in differential input mode. For floating signal sources, you need to add a resistor at each channel to provide a bias return path. The resistor value should be about 100 times the equivalent source impedance. If the source impedance is less than 100ohms, you can simply connect the negative side of the signal to AGND as well as the negative input of the Instrumentation Amplifier, without any resistors at all. In differential input mode, less noise couples into the signal connections than in single-ended mode.

**Figure 6: Floating source and differential input**

# 4

## Operation Theory

The operation theory of the functions on the DAQ/PXI-20XX is described in this chapter. The functions include the A/D conversion, D/A conversion, Digital I/O and General Purpose Counter/Timer. The operation theory can help you understand how to configure and program the DAQ/PXI-20XX.

The whole DAQ/PXI-2000 series cards, including DAQ/PXI-20XX, DAQ/PXI-22XX and DAQ/PXI-25XX, are designed based on the same logic-timing template of DAQ/PXI-22XX. In the DAQ/PXI-22XX cards, all the A/D related timings are for multiplexing A/D sampling based on scanning, so that DAQ/PXI-20XX also adopts the same concept, except there is only one conversion signal in a scan which could generate up to 4 samples from the different 4 channels at the same time. In the following description, to conform to the original timing design, we still use “scan” as the unit of A/D data acquisition. All the DA and GPTC functions are the same in DAQ/PXI-20XX and DAQ/PXI-22XX, while DAQ/PXI-25XX provides improved DA timing comparing the former 2 series.

---

### 4.1 A/D Conversion

When using an A/D converter, users should first know about the properties of the signal to be measured. Users can decide which channel to use and where to connect the signals to the card. Please refer to 3.2 for signal connections. In addition, users should define and control the A/D signal configurations, including channels, gains, and A/D signal types.

There are 2 ways to initiate A/D conversion, either by Software Polling or Programmable Scan Acquisition; these are described in 4.1.3 and 4.1.4.

The A/D acquisition is initiated by a trigger source; users must decide how to trigger the A/D conversion. The data acquisition will start once a trigger condition is matched.

After the end of A/D conversion, the A/D data is buffered in a Data FIFO. The A/D data should be transferred into the PC's memory for further processing.

#### 4.1.1 DAQ/PXI-2010 AI Data Format

##### 4.1.1.1 Synchronous Digital Inputs (for DAQ/PXI-2010 only)

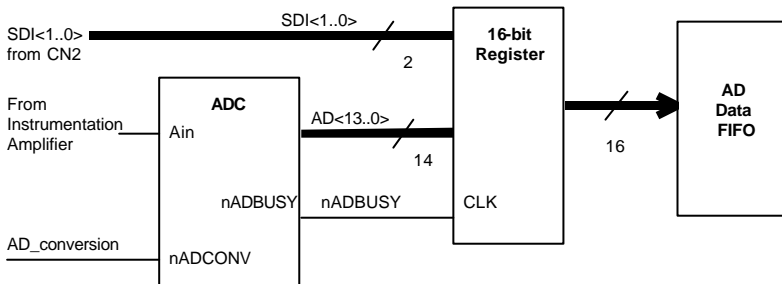

When each A/D conversion is completed, the 14-bits converted digital data accompanied with 2 bits of SDI<1..0>\_X per channel from J5 will be latched into the 16-bit register and data FIFO, as shown in Figure 7 and Figure 8. Therefore, users can simultaneously sample one analog signal with four digital signals. The data format of every acquired 16-bit data is as follows:

D13, D12, D11 ..... D1, D0, b1, b0

Where

D13, D12, D11 ..... D1, D0: 2's complement A/D 14-bit data

b1, b0: Synchronous Digital Inputs SDI<1..0>

**Figure 7: Synchronous Digital Inputs Block Diagram**

**Figure 8: Synchronous Digital Inputs timing**

---

**Note:** Since the analog signal is sampled when an A/D conversion starts (falling edge of A/D\_conversion signal), while SDI<1..0> are sampled right after an A/D conversion completes (rising edge of nADBUSH signal). Precisely SDI<1..0> are sampled within 220 to 400ns lag to the analog signal, due to the variation of the conversion time of the A/D converters.

---

Table 5 and 6 illustrate the ideal transfer characteristics of various input ranges of DAQ\PXI-20XX. The converted digital codes for DAQ\PXI-2010 are 14-bit and 2's complement, and here we present the codes as hexadecimal numbers. Note that the last 2 bits of the transferred data, which are the synchronous digital input (SDI), should be ignored when retrieving the analog data.

Description	Bipolar Analog Input Range				Digital code
	$\pm 10V$	$\pm 5V$	$\pm 2.5V$	$\pm 1.25V$	
Full-scale Range	$\pm 10V$	$\pm 5V$	$\pm 2.5V$	$\pm 1.25V$

**Table 6: Unipolar analog input range and the output digital code on DAQ/PXI-2010 (Note that the last 2 digital codes are SDI<1..0>)**

#### 4.1.2 DAQ/PXI-2005/2006 AI Data Format

The data format of the acquired 16-bit A/D data is Binary coding. Table 7 and 8 illustrate the valid input ranges and the ideal transfer characteristics. The converted digital codes for DAQ/PXI-2005/2006 are 16-bit and direct binary, and here we present the codes as hexadecimal numbers.

Description	Bipolar Analog Input Range				Digital code
	$\pm 10V$	$\pm 5V$	$\pm 2.5V$	$\pm 1.25V$	
Full-scale Range	$\pm 10V$	$\pm 5V$	$\pm 2.5V$	$\pm 1.25V$	
Least significant bit	305.2 $\mu V$	152.6 $\mu V$	76.3 $\mu V$	38.15 $\mu V$	
FSR-1LSB	9.999695V	4.999847V	2.499924V	1.249962V	FFFF
Midscale +1LSB	305.2 $\mu V$	152.6 $\mu V$	76.3 $\mu V$	38.15 $\mu V$	8001
Midscale	0V	0V	0V	0V	8000

-FSR	0V	0V	0V	0V	0000

**Table 8: Unipolar analog input range and the output digital code on the DAQ/PXI-2005/2006**

### **4.1.3 Software conversion with polling data transfer acquisition mode (Software Polling)**

This is the easiest way to acquire a single A/D data. The A/D converter starts one conversion whenever the dedicated software command is executed. Then the software would poll the conversion status and read the A/D data back when it is available.

This method is very suitable for applications that needs to process A/D data in real time. Under this mode, the timing of the A/D conversion is fully controlled under software. However, it is difficult to control the A/D conversion rate.

#### **4.1.3.1 Specifying Channel, Gain, and Polarity**

In both the Software Polling and programmable scan acquisition mode, the channel, gain, and polarity for each channel can be specified and selected. With this configuration, signal sources must be connected to the right connector as the specified settings.

When the specified channels have been sampled from the first to the last data, the settings applied to each channel would be the same until next change.

#### ***Example:***

Typically you can set the input configuration for different channels:

Ch1 with unipolar  $\pm 10V$

Ch2 with bipolar  $\pm 2.5V$

Ch3 with no signal input (disabled)

Ch4 with bipolar  $\pm 1.25V$

## 4.1.4 Programmable scan acquisition mode

### 4.1.4.1 Scan Timing and Procedure

It's recommended that this mode be used if your applications need a fixed and precise A/D sampling rate. You can accurately program the period between conversions of individual channels. There are at least 2 counters, which need to be specified:

SI\_counter (24 bit): Specify the **Scan Interval** = SI\_counter / TIMEBASE

PSC\_counter (24 bit): Specify **Post Scan Counts**, i.e. the total sample count after a trigger event,

The acquisition timing and the meanings of the 2 counters are illustrated in figure 9. The SCAN\_START signal is derived from the SI\_counter, which will lead to the A/D conversion signal generation. **Note that the DAQ/PXI-20XX series is a simultaneous sampling A/D card, so the "scan interval" equals to the "sampling interval".**

#### **Example: (Post-trigger acquisition)**

Set

SI\_counter = 160

PSC\_counter = 30

TIMEBASE = Internal clock source

Then

Scan Interval =  $160/40\text{M s} = 4\text{ us}$

Total acquisition time =  $30 \times 4\text{ us} = 120\text{ us}$

#### **TIMEBASE clock source**

In scan acquisition mode, all the A/D conversions start on the output of counters, which use **TIMEBASE** as the clock source. By software you can specify the TIMEBASE to be either an internal clock source (on-board 40MHz clock) or an external clock input (EXTTIMEBASE) on J5 connector (68-pin VHDCI). The external TIMEBASE is useful when you want to acquire data at rates not available with the internal A/D sample clock. The external clock source should generate TTL-compatible continuous clocks; with a maximum frequency of 40MHz while the minimum should be 1MHz. Please refer to 4.6 for information of user-controllable timing signals.

### 3 Scans (PSC\_Counter=3)

**Figure 9: Scan Timing**

There are 4 trigger modes to start the scan acquisition, please refer to section 4.1.4.2 for more details. The data transfer mode is discussed in section 4.1.4.3.

---

**Note:**

1. The maximum A/D sampling rate is 2MHz for DAQ/PXI-2010, 500kHz for DAQ/PXI-2005 and 250kHz for DAQ/PXI-2006. Therefore, the minimum setting of SI\_counter is 20 for DAQ/PXI-2010, 80 for DAQ/PXI-2005 and 160 for DAQ/PXI-2006 while using the internal TIMEBASE.
  2. The SI\_counter is a 24-bit counter. Therefore, the maximum scan interval while using an internal TIMEBASE =  $2^{24}/40M$  s = 0.419s.
- 

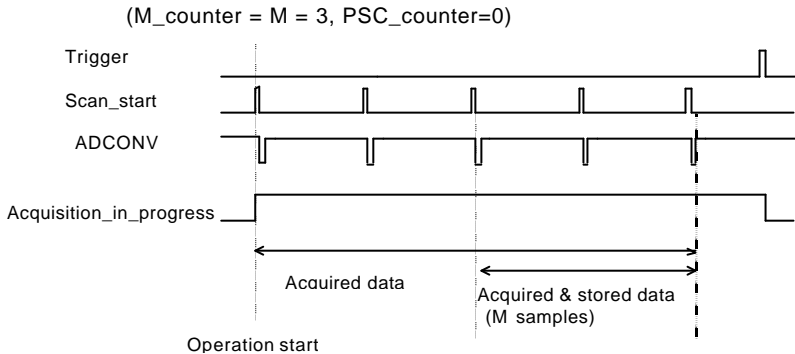

#### 4.1.4.2 Trigger Modes

DAQ/PXI-20XX provides 4 trigger sources (internal software trigger, external analog trigger, external digital trigger or SSI trigger signals). You must select one of them as the source of the trigger event. A trigger event occurs when the specified condition is detected on the selected trigger source (For example, a rising edge on the external digital trigger input). Please refer to section 4.6 for more information about SSI signals.

There are 4 trigger modes (pre-trigger, post-trigger, middle-trigger, and delay-trigger) working with the 4 trigger sources to initiate different scan data acquisition timing when a trigger event occurs. They are described as follows. For information of trigger sources, please refer to section 4.5.

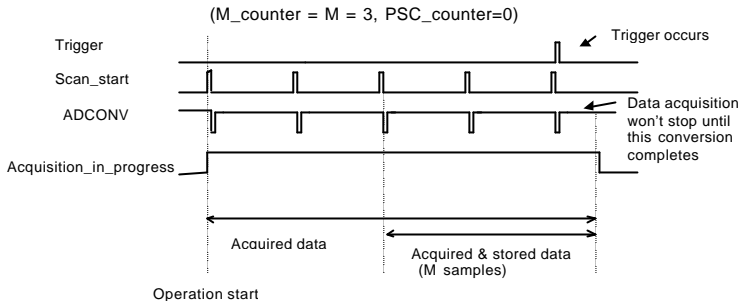

### **Pre-Trigger Acquisition**

Use pre-trigger acquisition in applications where you want to collect data before a trigger event. The A/D starts to sample when you execute the specified function calls to begin the pre-trigger operation, and it stops when the trigger event occurs. Users must program the value  $M$  in **M\_counter** (16 bits) to specify the amount of the stored scans before the trigger event. If an external trigger occurs, the program only stores the last  $M$  scans of data converted before the trigger event, as illustrated in figure 10, where  $M\_counter = M = 3$ ,  $PSC\_counter = 0$ . The post scan count is 0 because there is no sampling after the trigger event in pre-trigger acquisition. The total stored amount of data = Number of enabled channels \*  $M\_counter$ .

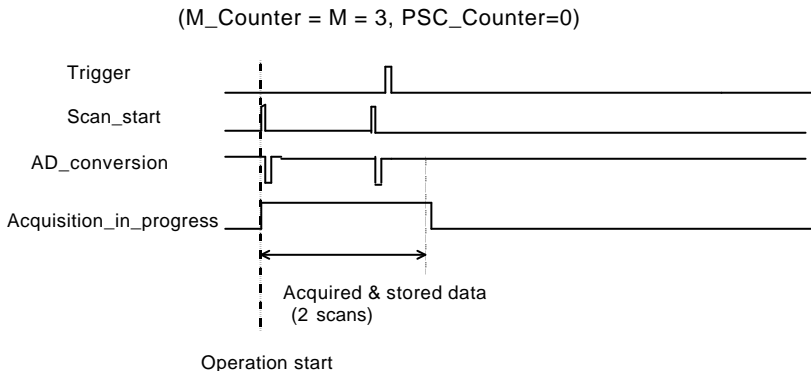

**Figure 10: Pre-trigger (trigger occurs after at least  $M$  scans acquired)**

Note that if the trigger event occurs when a conversion is in progress, the data acquisition won't stop until this conversion is completed, and the stored  $M$  scans of data include the last scan, as illustrated in figure 11, where  $M\_counter = M = 3$ ,  $PSC\_counter = 0$ .

**Figure 11: Pre-trigger scan acquisition (trigger occurs when a conversion is in progress)**

When the trigger signal occurs before the first M scans of data are converted, the amount of stored data could be fewer than the originally specified amount M\_counter, as illustrated in figure 12. This situation can be avoided by setting **M\_enable**. If **M\_enable** is set to 1, the trigger signal will be ignored until the first M scans of data are converted, and it assures the user M scans of data under pre-trigger mode, as illustrated in figure 13. However, if **M\_enable** is set to 0, the trigger signal will be accepted any time, as illustrated in figure 12. Note that the total amount of stored data will always be equal to the number in the M\_counter because the data acquisition won't stop until a scan is completed.

**Figure 12: Pre-trigger with M\_enable = 0 (Trigger occurs before M scans)**

(M\_counter = M = 3, PSC\_counter=0)

**Figure 13: Pre-trigger with M\_enable = 1**

---

**Note:** The PSC\_counter is set to 0 in pre-trigger acquisition mode.

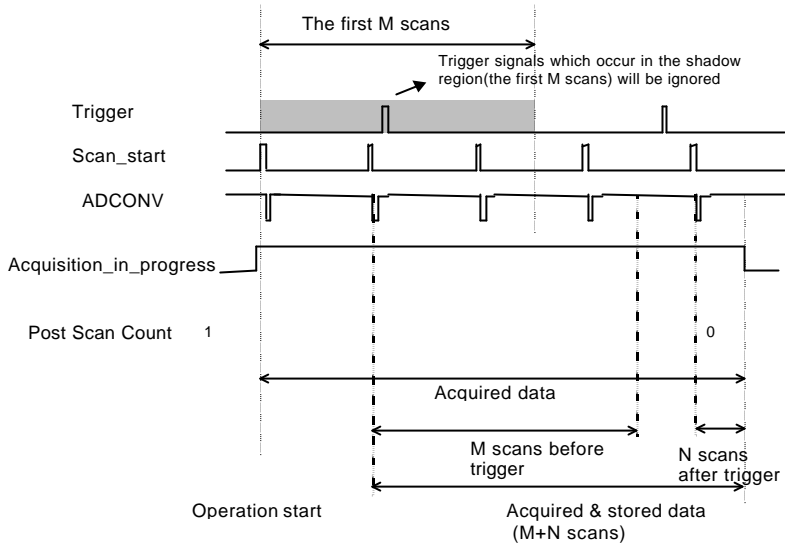

---

### ***Middle-Trigger Acquisition***

Use middle-trigger acquisition in applications where you want to collect data before and after a trigger event. The number of scans (M) stored before the trigger is specified in M\_counter, while the number of scans (N) after the trigger is specified in PSC\_counter.

Like pre-trigger mode, the number of stored data could be less than the specified amount of data (M+N), if an external trigger occurs before M scans of data are converted. The **M\_enable** bit in middle-trigger mode takes the same effect as in pre-trigger mode. If **M\_enable** is set to 1, the trigger signal will be ignored until the first M scans of data are converted, and it assures the user with (M+N) scans of data under middle-trigger mode. However, if **M\_enable** is set to 0, the trigger signal will be accepted at any time. Fig 14 shows the acquisition timing with M\_enable=1.

(M\_Counter=M=3, PSC\_Counter=N=1)

**Figure 14: Middle trigger with  $M\_enable = 1$**

If the trigger event occurs when a scan is in progress, the stored  $N$  scans of data would include this scan, as illustrated in Fig 15.

(M\_Counter=M=2, PSC\_Counter=N=2)

**Figure 15: Middle trigger (trigger occurs when a scan is in progress)**

---

**Note:** M\_counter defined in Middle-Trigger is different from that of Pre-Trigger. In Middle-trigger, M\_Counter ends counting **before the trigger event** while in Pre-Trigger, M\_Counter ends counting **right at or before trigger event**. Please refer to figure 11 and figure 15.

---

### Post-Trigger Acquisition

Use post-trigger acquisition in applications where you want to collect data after a trigger event. The number of scans after the trigger is specified in PSC\_counter, as illustrated in fig 16. The total acquired data length = number of enable-channel \* PSC\_counter.

**Figure 16: Post trigger**

### Delay Trigger Acquisition

Use delay trigger acquisition in applications where you want to delay the data collection after the occurrence of a specified trigger event. The delay time is controlled by the value, which is pre-loaded in the **Delay\_counter** (16bit). The counter counts down on the rising edge of the Delay\_counter clock source after the trigger condition is met. The clock source can be software programmed either by the TIMEBASE clock (40MHz) or A/D sampling clock (TIMEBASE / SI\_counter). When the count reaches 0, the counter stops and the card starts to acquire data. The total acquired data length = number of enable-channel \* PSC\_counter.

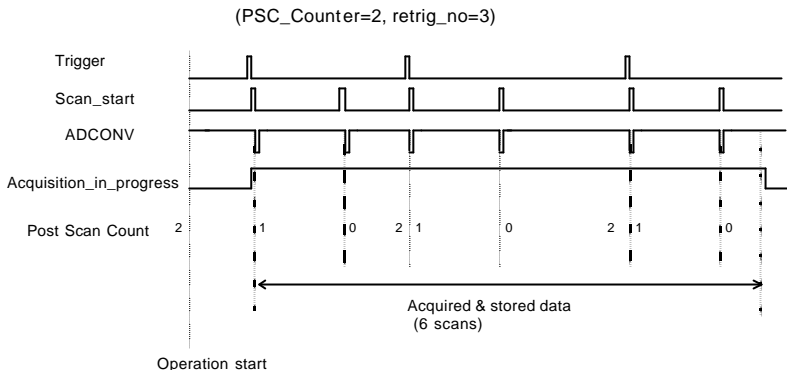

---

**Note:** When the Delay\_counter clock source is set to TIMEBASE, the maximum delay time =  $2^{16}/40M$  s = 1.638ms, and when the source is set to A/D sampling clock, the maximum delay time can be as higher as  $(2^{16} * SI\_counter / 40M)$ .

---

### ***Post-Trigger or Delay-trigger Acquisition with re-trigger***

Use post-trigger or delay-trigger acquisition with re-trigger function in applications where you want to collect data after several trigger events. The number of scans after each trigger is specified in PSC\_counter, and users could program **Retrig\_no** to specify the re-trigger numbers. Fig 18 illustrates an example. In this example, 2 scans of data is acquired after the first trigger signal, then the card waits for the re-trigger signal (re-trigger signals which occur before the first 2 scans is completed will be ignored). When the re-trigger signal occurs, 2 more scan is performed. The process repeats until specified amount of re-trigger signals are detected. The total acquired data length = number of enable-channel \* PSC\_counter \* Retrig\_no.

**Figure 18: Post trigger with re-trigger**

#### 4.1.4.3 Bus-mastering DMA Data Transfer

PCI bus-mastering DMA is necessary for high speed DAQ in order to utilize the maximum PCI bandwidth. The bus-mastering controller, which is built in the PLX IOP-480 PCI controller, controls the PCI bus when it becomes the master of the bus. Bus mastering reduces the size of the on-board memory and reduces the CPU loading because data is directly transferred to the computer's memory without host CPU intervention.

Bus-mastering DMA provides the fastest data transfer rate on PCI-bus. Once the analog input operation starts, control returns to your program. The hardware temporarily stores the acquired data in the on-board AD Data FIFO and then transfers the data to a user-defined DMA buffer memory in the computer. Please note that even when the acquired data length is less than the Data FIFO, the AD data will not be kept in the Data FIFO but directly transferred into host memory by the bus-mastering DMA.

The DMA transfer mode is very complex to program. We recommend using a high-level program library to configure this card. If users would like to know more about programs/software's that can handle the DMA bus master data transfer, please refer to <http://www.plxtech.com> for more information on PCI controllers.

By using a high-level programming library for high speed DMA data acquisition, users simply need to assign the sampling period and the number of conversion into their specified counters. After the AD trigger condition is matched, the data will be transferred to the system memory by the bus-mastering DMA.

The PCI controller also supports the function of scatter/gather bus mastering DMA, which helps the users to transfer large amounts of data by linking all the memory blocks into a continuous linked list.

In a multi-user or multi-tasking OS, like Microsoft Windows, Linux, and so on, it is difficult to allocate a large continuous memory block to do the DMA transfer. Therefore, the PLX IOP-480 provides the function of scatter/gather or chaining mode DMA to link the non-continuous memory blocks into a linked list so that users can transfer very large amounts of data without being limited by the fragment of small size memory. Users can configure the linked list for the input DMA channel or the output DMA channel. Figure 19 shows a linked list that is constructed by three DMA descriptors. Each descriptor contains a PCI address, a local address, a transfer size, and the pointer to the next descriptor. Users can allocate many small size memory blocks and chain their associative DMA descriptors altogether by their application programs. DAQ/PXI-20XX software driver provides simple settings of the scatter/gather function, and some sample programs are also provided within the ADLINK all-in-one CD.

**Figure 19: Scatter/gather DMA for data transfer**

In non-chaining mode, the maximum DMA data transfer size is 2M double words (8M bytes). However, by using chaining mode, scatter/gather, there is no limitation on DMA data transfer size. Users can also link the descriptor nodes circularly to achieve a multi-buffered mode DMA.

---

## 4.2 D/A Conversion

There are 2 channels of 12-bit D/A output available in the DAQ/PXI-20XX. When using D/A converters, users should assign and control the D/A converter reference sources for the D/A operation mode and D/A channels. Users could also select the output polarity: unipolar or bipolar.

The reference selection control lets users fully utilize the multiplying characteristics of the D/A converters. Internal 10V reference and external reference inputs are available in the DAQ/PXI-20XX. The range of the D/A output is directly related to the reference. The digital codes that are updated to the D/A converters will multiply with the reference to generate the analog output. While using internal 10V reference, the full range would be  $-10V \sim +9.9951V$  in the bipolar output mode, and  $0V \sim 9.9976V$  in the unipolar output mode. While using an external reference, users can reach different output ranges by connecting different references. For example, if connecting a DC  $-5V$  with the external reference, then the users can get a full range from  $-4.9976V$  to  $+5V$  in the bipolar output with inverting characteristics due to the negative reference voltage. Users could also have an amplitude modulated (AM) output by feeding a sinusoidal signal into the reference input. The range of the external reference should be within  $\pm 10V$ . Table 9 and 10 illustrates the relationship between digital code and output voltages.

Digital Code	Analog Output
111111111111	$V_{ref} * (2047/2048)$
100000000001	$V_{ref} * (1/2048)$
100000000000	0V
011111111111	$-V_{ref} * (1/2048)$
000000000000	$-V_{ref}$

**Table 9: Bipolar output code table ( $V_{ref}=10V$  if internal reference is selected)**

Digital Code	Analog Output
111111111111	$V_{ref} * (4095/4096)$
100000000000	$V_{ref} * (2048/4096)$
000000000001	$V_{ref} * (1/4096)$
000000000000	0V

**Table 10: Unipolar output code table ( $V_{ref}=10V$  if internal reference is selected)**

The D/A conversion is initiated by a trigger source. Users must decide how to trigger the D/A conversion. The data output will start when a trigger condition is met. Before the start of D/A conversion, D/A data is transferred from PC's main memory to a buffering Data FIFO.

There are two modes of the D/A conversion: Software Update and Timed Waveform Generation are described, including timing, trigger source control, trigger modes and data transfer methods. **Either mode may be applied to D/A channels independently.** You can software update DA CH0 while generate timed waveforms on CH1 at the same time.

#### 4.2.1 Software Update

This is the easiest way to generate D/A output. First, users should specify the D/A output channels, set output polarity: unipolar or bipolar, and reference source: internal 10V or external AOEXTREF. Then update the digital values into D/A data registers through a software output command.

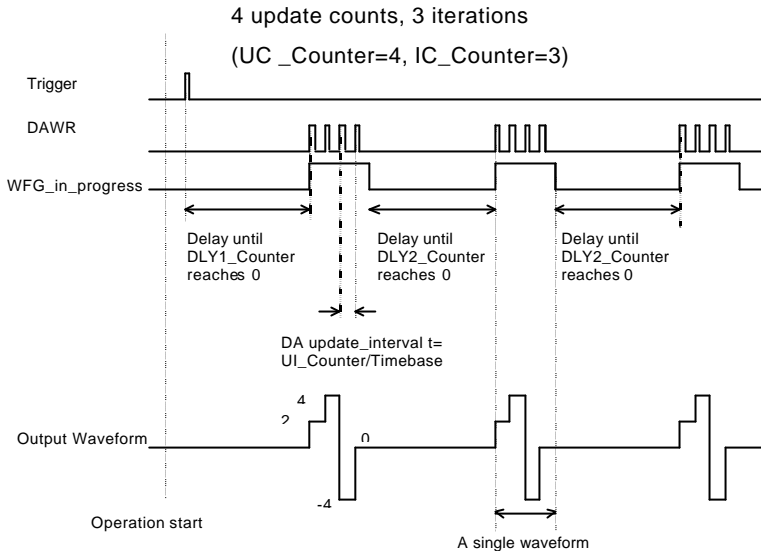

#### 4.2.2 Timed Waveform Generation

This mode can provide your applications with a precise D/A output with a fixed update rate. It can be used to generate an infinite or finite waveform. You can accurately program the update period of the D/A converters.

The D/A output timing is provided through a combination of counters in the FPGA on board. There are totally 5 counters to be specified. These counters are:

- UI\_counter (24 bits): specify the DA **Update Interval** =  $CHUI\_counter/TIMEBASE$ .
- UC\_counter (24 bits): specify the total **Update Counts** in a single waveform
- IC\_counter (24 bits): specify the **Iteration Counts** of waveform.
- DA\_DLY1\_counter (16 bits): specify the **Delay** from the trigger to the first update start.
- DA\_DLY2\_counter (16 bits): specify the **Delay** between two consecutive waveform generations.

Figure 20 shows a typical D/A timing diagram. D/A updates its output on each rising edge of DAWR. The meaning of the counters above is discussed more in the following sections.

**Figure 20: Typical D/A timing of waveform generation (Assuming the data in the data buffer are 2V, 4V, -4V, 0V)**

---

**Note:**

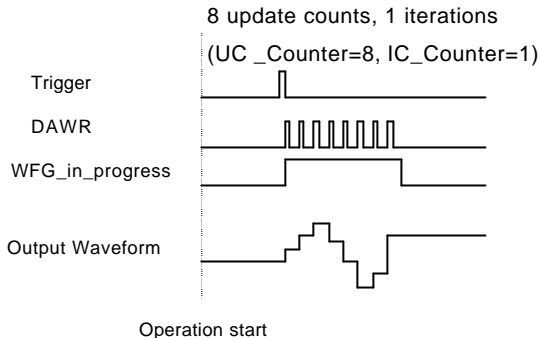

1. The maximum D/A update rate is 1MHz. Therefore, the minimum setting of the UI\_counter is 40 while using an internal TIMEBASE(40MHz).

---

**4.2.2.1 Trigger Modes**

**Post-Trigger Generation**

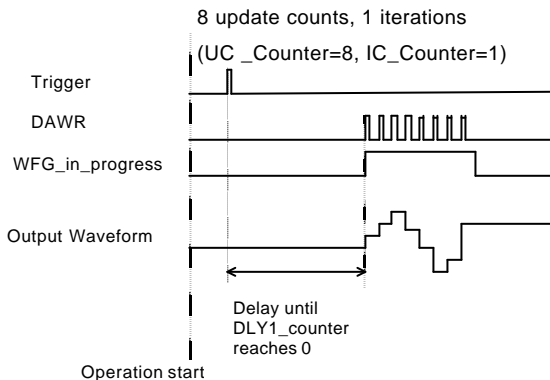

Use post trigger when you want to perform DA waveform right after a trigger event occurs. In this trigger mode DLY1\_Counter is not used and you don't need to specify it. Figure 21 shows a single waveform generated right after a trigger signal is detected. The trigger signal could come from a software command, an analog trigger or a digital trigger. Please refer to section 4.5 for detailed information.

**Figure 21: Post trigger waveform generation (Assuming the data in the data buffer are 2V, 4V, 6V, 3V, 0V, -4V, -2V, 4V)**

### ***Delay-Trigger Generation***

Use delay trigger when you want to delay the waveform generation after a trigger event. In figure 22, DA\_DLY1\_counter determines the delay time from the trigger signal to the start of the waveform generation. DLY1\_counter counts down on the rising edge of its clock source after the trigger condition is met. When the count reaches 0, the counter stops and the DAQ/PXI-20XX starts the waveform generation. This DLY1\_Counter is 16-bit's wide and users can set the delay time in units of TIMEBASE (delay time = DLY1\_Counter/TIMEBASE) or in units of update period (delay time = DLY1\_Counter \* UI\_counter/TIMEBASE), such that the delay time can reach a wider range.

**Figure 22: Delay trigger waveform generation (Assuming the data in the data buffer are 2V, 4V, 6V, 3V, 0V, -4V, -2V, 4V)**

### **Post-Trigger or Delay-Trigger with Re-trigger**

Use post-trigger or delay-trigger with re-trigger function when you want to generate waveform after more than one trigger events. The re-trigger function can be enabled or disabled by software setting. In figure 23, each trigger signal will initiate a waveform generation. However, the trigger event would be ignored while the waveform generation is ongoing.

**Figure 23: Re-triggered waveform generation (Assuming the data in the data buffer are 2V, 4V, 2V, 0V)**

#### **4.2.2.2 Iterative Waveform Generation**

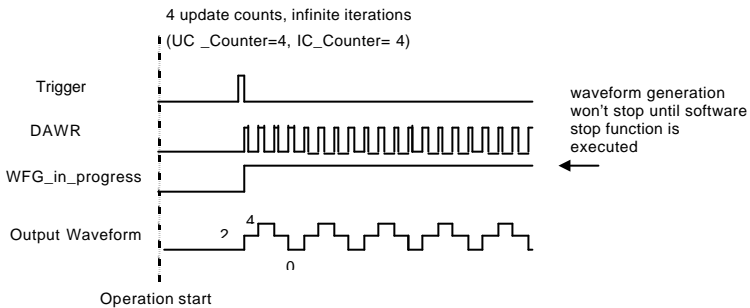

Set IC\_Counter in order to generate iterative waveforms from the data of a single waveform. The counter stores the iteration number, and the iterations can be finite (Figure 24) or infinite (Figure 25).

A data FIFO on board is used to buffer the digital data for DA output. If the data size of a single waveform you specified (That is, Update Counts in UC\_counter) is less than the FIFO size, after initially transferring the data from the host PC memory to the FIFO on board, the data in the FIFO will be automatically re-transmitted whenever a single waveform is completed. Therefore, it won't occupy the PCI bandwidth when repetitive waveforms are performed. However, if the size of a single waveform were larger than that of the FIFO, it needs to be intermittently loaded from the host PC's memory via DMA, when a repetitive waveforms is performed thus PCI bandwidth would be occupied.

The data FIFO size on DAQ/PXI-2010 is 2k samples and on DAQ/PXI-2005/2006 it is 512 samples.

**Figure 24: Finite iterative waveform generation with Post-trigger and DLY2\_Counter = 0 (Assuming the data in the data buffer are 2V, 4V, 2V, 0V)**

**Figure 25: Infinite iterative waveform generation with Post-trigger and DLY2\_Counter = 0 (Assuming the data in the data buffer are 2V, 4V, 2V, 0V)**

**Note:**

1. When running infinite iterative waveform generation, setting IC\_Counter is ineffective to the waveform generation. It only makes a difference when setting stop mode III, please refer to section 4.2.2.3.
2. How to set finite and infinite iterative waveform generation is not included in this manual. Please refer to software manual for further information.

### ***Delay2 in Repetitive Waveform Generation***

To diversify the D/A waveform generation, we add a DLY2 Counter to separate 2 consecutive waveforms in repetitive waveform generation. The time between two waveforms is set by the value of DLY2 Counter. The Delay2 counter starts to count down after a waveform generation finishes, and the next waveform generation starts right after it counts down to zero, just as shown in figure 20. This DLY2\_Counter is 16-bits wide and users can set the delay time in units of TIMEBASE (delay time =  $DLY2\_Counter/TIMEBASE$ ) or in units of update period (delay time =  $DLY2\_Counter * UI\_counter/TIMEBASE$ ), such that the delay time can reach a wider range

#### ***4.2.2.3 Stop Modes of Scan Update***

You can call software stop function to stop waveform generation when it is still in progress. Three stop modes are provided for timed waveform generation, which means when it is to stop the waveform generation. You can apply these 3 modes to stop waveform generation no matter infinite or finite waveform generation mode is selected.

Figure 26 illustrates an example for stop mode I, in this mode the waveform stops immediately when software command is asserted.

In stop mode II, after a software stop command is given, the waveform generation won't stop until a complete single waveform is finished. Take figure 27 for an example, since UC\_counter is set to 4, the total DA update counts (that is, number of pulses of DAWR signal) must be a multiple of 4.(update counts = 20 in this example)

In stop mode III, after a software stop command is given, the waveform generation won't stop until the performed number of waveforms is a multiple of IC\_Counter. Take figure 28 for an example, since IC\_Counter is set to 3, the total generated waveforms must be a multiple of 3(waveforms = 6 in this example), and the total DA update counts must be a multiple of 12( $UC\_counter * IC\_Counter$ ). You can compare these three figures to see their differences.

**Figure 26: Stop mode I**  
(Assuming the data in the data buffer are 2V, 4V, 2V, 0V)

**Figure 27: Stop mode II**

**Figure 28: Stop mode III**

---

## 4.3 Digital I/O

The DAQ/PXI-20XX contains 24-lines of general-purpose digital I/O (GPIO), which is provided through a 82C55A chip.

The 24-line GPIO are separated into three ports: Port A, Port B and Port C. High nibble (bit[7...4]), and low nibble (bit[3...0]) of each port can be individually programmed to be either inputs or outputs. Upon system startup or reset, all the GPIO pins are reset to high impedance inputs.

DAQ/PXI-2010 also provides 2 digital inputs per channel (SDI from J5), which are sampled simultaneously with an analog signal input and is stored with the 14-bit AD data. Please refer to section 4.1.1.1 for the more details.

---

## 4.4 General Purpose Timer/Counter Operation

Two independent 16-bit up/down timer/counter are designed within FPGA for various applications. They have the following features:

- Count up/down controlled by hardware or software
- Programmable counter clock source (internal or external clock up to 10MHz)
- Programmable gate selection (hardware or software control)
- Programmable input and output signal polarities (high active or low active)
- Initial Count can be loaded from software
- Current count value can be read-back by software without affecting circuit operation

### 4.4.1 Timer/Counter functions basics

Each timer/counter has three inputs that can be controlled via hardware or software. They are clock input (GPTC\_CLK), gate input (GPTC\_GATE), and up/down control input (GPTC\_UPDOWN). The GPTC\_CLK input provides a clock source input to the timer/counter. Active edges on the GPTC\_CLK input make the counter increment or decrement. The GPTC\_UPDOWN input controls whether the counter counts up or down. The GPTC\_GATE input is a control signal which acts as a counter enable or a counter trigger signal under different applications.

The output of timer/counter is GPTC\_OUT. After power-up, GPTC\_OUT is pulled high by a pulled-up resistor about 10K ohms. Then GPTC\_OUT goes low after the DAQ/PXI-20XX is initialized.

All the polarities of input/output signals can be programmed by software. In this chapter, for easy explanation, all GPTC\_CLK, GPTC\_GATE, and GPTC\_OUT are assumed to be active high or rising-edge triggered in the figures.

#### 4.4.2 General Purpose Timer/Counter modes

Eight programmable timer/counter modes are provided. All modes start operating following a software-start signal that is set by the software. The GPTC software reset initializes the status of the counter and re-loads the initial value to the counter. The operation remains halted until the software-start is re-executed. The operating theories under different modes are described as below.

##### 4.4.2.1 Mode 1: Simple Gated-Event Counting

In this mode, the counter counts the number of pulses on the GPTC\_CLK after the software-start. Initial count can be loaded from software. Current count value can be read-back by software any time without affecting the counting. GPTC\_GATE is used to enable/disable counting. When GPTC\_GATE is inactive, the counter halts the current count value. Figure 29 illustrates the operation with initial count = 5, count-down mode.

Figure 29: Mode 1 Operation

##### 4.4.2.2 Mode 2: Single Period Measurement

In this mode, the counter counts the period of the signal on GPTC\_GATE in terms of GPTC\_CLK. Initial count can be loaded from software. After the software-start, the counter counts the number of active edges on GPTC\_CLK between two active edges of GPTC\_GATE. After the completion of the period interval on GPTC\_GATE, GPTC\_OUT outputs high and then current count value can be read-back by software. Figure 30 illustrates the operation where initial count = 0, count-up mode.

**Figure 30: Mode 2 Operation**

#### **4.4.2.3 Mode 3: Single Pulse-width Measurement**

In this mode the counter counts the pulse-width of the signal on GPTC\_GATE in terms of GPTC\_CLK. Initial count can be loaded from software. After the software-start, the counter counts the number of active edges on GPTC\_CLK when GPTC\_GATE is in its active state. After the completion of the pulse-width interval on GPTC\_GATE, GPTC\_OUT outputs high and then current count value can be read-back by software. Figure 31 illustrates the operation where initial count = 0, count-up mode.

**Figure 31: Mode 3 Operation**

#### **4.4.2.4 Mode 4: Single Gated Pulse Generation**

This mode generates a single pulse with programmable delay and programmable pulse-width following the software-start. The two programmable parameters could be specified in terms of periods of the GPTC\_CLK input by software. GPTC\_GATE is used to enable/disable counting. When GPTC\_GATE is inactive, the counter halts the current count value. Figure 32 illustrates the generation of a single pulse with a pulse delay of two and a pulse-width of four.

**Figure 32: Mode 4 Operation**

#### 4.2.2.5 Mode 5: Single Triggered Pulse Generation

This function generates a single pulse with programmable delay and programmable pulse-width following an active GPTC\_GATE edge. You could specify these programmable parameters in terms of periods of the GPTC\_CLK input. Once the first GPTC\_GATE edge triggers the single pulse, GPTC\_GATE takes no effect until the software-start is re-executed. Figure 33 illustrates the generation of a single pulse with a pulse delay of two and a pulse-width of four.

**Figure 33: Mode 5 Operation**

#### 4.2.2.6 Mode 6: Re-triggered Single Pulse Generation

This mode is similar to mode5 except that the counter generates a pulse following every active edge of GPTC\_GATE. After the software-start, every active GPTC\_GATE edge triggers a single pulse with programmable delay and pulse-width. Any GPTC\_GATE triggers that occur when the prior pulse is not completed would be ignored. Figure 34 illustrates the generation of two pulses with a pulse delay of two and a pulse-width of four.

**Figure 34: Mode 6 Operation**

**4.2.2.7 Mode 7: Single Triggered Continuous Pulse Generation**

This mode is similar to mode5 except that the counter generates continuous periodic pulses with programmable pulse interval and pulse-width following the first active edge of GPTC\_GATE. Once the first GPTC\_GATE edge triggers the counter, GPTC\_GATE takes no effect until the software-start is re-executed. Figure 35 illustrates the generation of two pulses with a pulse delay of four and a pulse-width of three.

**Figure 35: Mode 7 Operation**

**4.2.2.8 Mode 8: Continuous Gated Pulse Generation**

This mode generates periodic pulses with programmable pulse interval and pulse-width following the software-start. GPTC\_GATE is used to enable/disable counting. When GPTC\_GATE is inactive, the counter halts the current count value. Figure 36 illustrates the generation of two pulses with a pulse delay of four and a pulse-width of three.

**Figure 36: Mode 8 Operation**

---

## 4.5 Trigger Sources

We provide flexible trigger selections in the DAQ/PXI-20XXseries products. In addition to the internal software trigger, DAQ/PXI-20XX also supports external analog, digital triggers and SSI triggers. Users can configure the trigger source by software for A/D and D/A processes individually. **Note that the A/D and the D/A conversion share the same analog trigger.**

### 4.5.1 Software-Trigger

This trigger mode does not need any external trigger source. The trigger asserts right after you execute the specified function calls to begin the operation. A/D and D/A processes can receive an individual software trigger.

### 4.5.2 External Analog Trigger

The analog trigger circuitry routing is shown in the figure 37. The analog multiplexer can select either a direct analog input from the EXTATRIG pin (SRC1 in figure 37) in the 68-pin connector or the input signal of ADC (SRC2 in figure 37). That is, one of the 4 channel inputs you can select as a trigger source). Both trigger sources can be used for all trigger modes. The range of trigger level for SRC1 is  $\pm 10V$  and the resolution is 78mV (please refer to Table 11), while the trigger range of SRC2 is the full-scale range of the selected channel input, and the resolution is the desired range divided by 256. For example, if the channel input selected to be the trigger source is set bipolar and  $\pm 5V$  range, the trigger voltage would be 4.96V when the trigger level code is set to 0xFF while 0V when the code is set to 0x80.

Figure 37: Analog trigger block diagram

Trigger Level digital setting	Trigger voltage
0xFF	9.92V
0xFE	9.84V
---	---
0x81	0.08V
0x80	0
0x7F	-0.08V
---	---
0x01	-9.92V

**Table 11: Analog trigger SRC1 (EXTATRIG) ideal transfer characteristic**

The trigger signal is generated when the analog trigger condition is satisfied. There are five analog trigger conditions in the DAQ/PXI-20XX. The DAQ/PXI-20XX uses 2 threshold voltages, Low\_Threshold and High\_Threshold to build the 5 different trigger conditions. Users could configure the trigger conditions easily by software.

#### **4.5.2.1 Below-Low analog trigger condition**

Figure 38 shows the below-low analog trigger condition, the trigger signal is generated when the input analog signal is less than the Low\_Threshold voltage, and the High\_Threshold setting is not used in this trigger condition.

**Figure 38: Below-Low analog trigger condition**

#### 4.5.2.2 Above-High analog trigger condition

Figure 39 shows the above-high analog trigger condition, the trigger signal is generated when the input analog signal is higher than the High\_Threshold voltage, and the Low\_Threshold setting is not used in this trigger condition.

Figure 39: Above-High analog trigger condition

#### 4.5.2.3 Inside-Region analog trigger condition

Figure 40 shows the inside-region analog trigger condition, the trigger signal is generated when the input analog signal level falls in the range between the High\_Threshold and the Low\_Threshold voltages.

Figure 40: Inside-Region analog trigger condition

#### 4.5.2.4 High-Hysteresis analog trigger condition

Figure 41 shows the high-hysteresis analog trigger condition, the trigger signal is generated when the input analog signal level is greater than the High\_Threshold voltage, and the Low\_Threshold voltage determines the hysteresis duration.

Figure 41: High-Hysteresis analog trigger condition

#### 4.5.2.5 Low-Hysteresis analog trigger condition

Figure 42 shows the low-hysteresis analog trigger condition, the trigger signal is generated when the input analog signal level is less than the Low\_Threshold voltage, and the High\_Threshold voltage determines the hysteresis duration.

Figure 42: Low-Hysteresis analog trigger condition

### 4.5.3 External Digital Trigger

An external digital trigger occurs when a rising edge or a falling edge is detected on the digital signal connected to the EXTDRIG or the EXTWFTRG of the 68-pin connector for external digital trigger. The EXTDRIG is dedicated for A/D process, and the EXTWFTRG is used for D/A process. Users can program the trigger polarity through ADLINK's software drivers easily. Note that the signal level of the external digital trigger signals should be TTL-compatible, and the minimum pulse is 20ns.

Figure 43: External digital trigger

---

## 4.6 User-controllable Timing Signals

In order to meet the requirements for user-specific timing and the requirements for synchronizing multiple cards, the DAQ/PXI-20XX series provides flexible user-controllable timing signals to connect to external circuitry or additional cards.

The whole DAQ timing of the DAQ/PXI-20XX series is composed of a bunch of counters and trigger signals in the FPGA. These timing signals are related to the A/D, D/A conversions and Timer/Counter applications. These timing signals can be inputs to or outputs from the I/O connectors, the SSI connector and the PXI bus. Therefore the internal timing signals can be used to control external devices or circuitry's. Note that in different series of DAQ/PXI-20XX, the user-controllable timing signals would be slightly different. However, the SSI/PXI timing signals remain the same for every DAQ/PXI-20XX card.

We implemented signal multiplexers in the FPGA to individually choose the desired timing signals for the DAQ operations, as shown in the figure 44.

**Figure 44: DAQ signals routing**

Users can utilize the flexible timing signals through our software drivers, and simply and correctly connect the signals with the DAQ/PXI-20XX series cards. Here is the summary of the DAQ timing signals and the corresponding functionalities for DAQ/PXI-20XX series.

Timing signal category	Corresponding functionality
SSI/PXI signals	Multiple cards synchronization
AFI signals	Control DAQ-2000 by external timing signals
AI_Trig_Out, AO_Trig_Out	Control external circuitry or boards

**Table 12: Summary of user-controllable timing signals and the corresponding functionalities**

#### 4.6.1 DAQ timing signals

The user-controllable internal timing-signals contain: (Please refer to Section 4.1.4 for the internal timing signal definition)

1. TIMEBASE, providing TIMEBASE for all DAQ operations, which could be from internal 40MHz oscillator, EXTTIMEBASE from I/O connector or the SSI\_TIMEBASE. Note that the frequency range of the EXTTIMEBASE is 1MHz to 40MHz, and the EXTTIMEBASE should be TTL-compatible.
2. AD\_TRIG, the trigger signal for the A/D operation, which could come from external digital trigger, analog trigger, internal software trigger and SSI\_AD\_TRIG. Refer to Section 4.5 for detailed description.

3. SCAN\_START, the signal to start a scan, which would bring the following ADCONV signals for AD conversion, and could come from the internal SI\_counter, AFI[0] and SSI\_AD\_START. This signal is synchronous to the TIMEBASE. Note that the AFI[0] should be TTL-compatible and the minimum pulse width should be the pulse width of the TIMEBASE to guarantee correct functionalities.
4. ADCONV, the conversion signal to initiate a single conversion, which could be derived from internal counter, AFI[0] or SSI\_ADCONV. Note that this signal is edge-sensitive. When using AFI[0] as the external ADCONV source, each **rising edge** of AFI[0] would bring an effective conversion signal. Also note that the AFI[0] signal should be TTL-compatible and the minimum pulse width is 20ns.
5. DA\_TRIG, the trigger signal for the D/A operation, which could be derived from external digital trigger, analog trigger, internal software trigger and SSI\_AD\_TRIG. Refer to Section 4.5 for detailed description.
6. DAWR, the update signal to initiate a single D/A conversion, which could be derived from internal counter, AFI[1] or SSI\_DAWR. Note that this signal is edge-sensitive. When using AFI[1] as the external DAWR source, each **rising edge** of AFI[1] would bring an effective update signal. Also note that the AFI[1] signal should be TTL-compatible and the minimum pulse width is 20ns.

#### 4.6.2 Auxiliary Function Inputs (AFI)

Users could use the AFI in applications that take advantage of external circuitry to directly control the DAQ/PXI-2000 series cards. The AFI includes 2 categories of timing signals: one group is the dedicated input, and the other is the multi-function input. Table 13 illustrates this categorization.

Table 13 summarizes the auxiliary function input signals and the corresponding functionalities

Category	Timing signal	Functionality	Constraints
Dedicated input	EXTTIMEBASE	Replace the internal TIMEBASE	<ol style="list-style-type: none"> <li>1. TTL-compatible</li> <li>2. 1MHz to 40MHz</li> <li>3. Affects on both A/D and D/A operations</li> </ol>
	EXTDTRIG	External digital trigger input for A/D operation	<ol style="list-style-type: none"> <li>1. TTL-compatible</li> <li>2. Minimum pulse width = 20ns</li> <li>3. Rising edge or falling edge</li> </ol>
	EXTWFTRG	External digital trigger input for D/A operation	<ol style="list-style-type: none"> <li>1. TTL-compatible</li> <li>2. Minimum pulse width = 20ns</li> <li>3. Rising edge or falling edge</li> </ol>
Multi-function input	AFI[0] (Dual functions)	Replace the internal ADCONV	<ol style="list-style-type: none"> <li>1. TTL-compatible</li> <li>2. Minimum pulse width = 20ns</li> <li>3. Rising-edge sensitive only</li> </ol>
		Replace the internal SCAN_START	<ol style="list-style-type: none"> <li>1. TTL-compatible</li> <li>2. Minimum Pulse width &gt; 2/TIMEBASE</li> </ol>
	AFI[1]	Replace the internal DAWR	<ol style="list-style-type: none"> <li>1. TTL-compatible</li> <li>2. Minimum pulse width = 20ns</li> <li>3. Rising-edge sensitive only</li> </ol>

**Table 13: Auxiliary function input signals and the corresponding functionalities**

***EXTDTRIG and EXTWFTRIG***

EXTDTRIG and EXTWFTRIG are dedicated digital trigger input signals for A/D and D/A operations respectively. Please refer to section 4.5.3 for detailed descriptions.

## **EXTTIMEBASE**

When the applications needs specific sampling frequency or update rate that the card could not generate from its internal TIMEBASE, the 40MHz clock, users could utilize the EXTTIMEBASE with internal counters to achieve the specific timing intervals for both A/D and D/A operations. Note that once you choose the TIMEBASE source, both A/D and D/A operations will be affected because A/D and D/A operations share the same TIMEBASE.

## **AFI[0]**

Alternatively, users can also directly apply an external A/D conversion signal to replace the internal ADCONV signal. This is another way to achieve customized sampling frequencies. The external ADCONV signal can only be inputted from the AFI[0]. As section 4.1 describes, the SI\_counter triggers the generation of the A/D conversion signal, ADCONV, but when using the AFI[0] to replace the internal ADCONV signal, then the SI\_counter and the internally generated SCAN\_START will not be effective. By controlling the ADCONV externally, users can sample the data according to external events. In this mode, the Trigger signal and trigger mode settings will are not available.

AFI[0] could also be used as SCAN\_START signal for A/D operations. Please refer to sections 4.1 and 4.6.1 for detailed descriptions of the SCAN\_START signal. When using external signal (AFI[0]) to replace the internal SCAN\_START signal, the pulse width of the AFI[0] must be greater than two time of the period of Timebase. This feature is suitable for the DAQ-2200/PXI-2200 series, which can scan multiple channels data controlled by an external event. Note that the AFI[0] is a multi-purpose input, and it can only be utilized for one function at any one time.

## **AFI[1]**

Regarding the D/A operations, users could directly input the external D/A update signal to replace the internal DAWR signal. This is another way to achieve customized D/A update rates. The external DAWR signal can only be inputted from the AFI[1]. Note that the AFI[1] is a multi-purpose input, and it can only be utilized for one function at any one time. AFI[1] currently only has one function. ADLINK reserves it for future development.

### **4.6.3 System Synchronization Interface**

SSI (System Synchronization Interface) provides the DAQ timing synchronization between multiple cards. In DAQ/PXI-20XX series, we designed a bi-directional SSI I/O to provide flexible connection between cards and allow one SSI master to output the signal and up to three slaves to receive the SSI signal. Note that the SSI signals are designed for card synchronization only, not for external devices.

SSI timing signal	Functionality
SSI_TIMEBASE	SSI master: send the TIMEBASE out SSI slave: accept the SSI_TIMEBASE to replace the internal TIMEBASE signal. Note: Affects on both A/D and D/A operations
SSI_AD_TRIG	SSI master: send the internal AD_TRIG out SSI slave: accept the SSI_AD_TRIG as the digital trigger signal.
SSI_ADCONV	SSI master: send the ADCONV out SSI slave: accept the SSI_ADCONV to replace the internal ADCONV signal.
SSI_SCAN_START	SSI master: send the SCAN_START out SSI slave: accept the SSI_SCAN_START to replace the internal SCAN_START signal.
SSI_DA_TRIG	SSI master: send the DA_TRIG out. SSI slave: accept the SSI_DA_TRIG as the digital trigger signal.
SSI_DAWR	SSI master: send the DAWR out. SSI slave: accept the SSI_DAWR to replace the internal DAWR signal.

**Table 14: Summary of SSI timing signals and the corresponding functionalities as the master or slave**

In PCI form factor, there is a connector on the top right corner of the card for the SSI. Refer to section 2.3 for the connector position. All the SSI signals are routed to the 20-pin connector from the FPGA. To synchronize multiple cards, users can connect a special ribbon cable (ACL-SSI) to all the cards in a daisy-chain configuration

In PXI form factor, we utilize the PXI trigger bus built on the PXI backplane to provide the necessary timing signal connections. All the SSI signals are routed to the P2 connector. No additional cable is needed. For detailed information of the PXI specifications, please refer to PXI specification Revision 2.0 from PXI System Alliance ([www.pxisa.org](http://www.pxisa.org)).

The 6 internal timing signals could be routed to the SSI or the PXI trigger bus through software drivers. Please refer to section 4.6.1 for detailed information of the 6 internal timing signals. Physically the signal routings are accomplished in the FPGA. Cards that are connected together through the SSI or the PXI trigger bus, will still achieve synchronization on the 6 timing signals.

### ***The mechanism of the SSI/PXI***

1. We adopt master-slave configuration for SSI/PXI. In a system, for each timing signal, there shall be only one master, and other cards are SSI slaves or with the SSI function disabled.
2. For each timing signal, the SSI master doesn't have to be in a single card.

*For example:*

We want to synchronize the A/D operation through the ADCONV signal for 4 DAQ/PXI-20XX cards. Card 1 is the master, and Card 2, 3, 4 are slaves. Card 1 receives an external digital trigger to start the post trigger mode acquisition. The SSI setting could be:

- a. Set the SSI\_ADCONV signal of Card 1 to be the master.
- b. Set the SSI\_ADCONV signals of Card 2, 3, 4 to be the slaves.
- c. Set external digital trigger for Card 1's A/D operation.
- d. Set the SI\_counter and the post scan counter (PSC) of all other cards.
- e. Start DMA operations for all cards, thus all the cards are waiting for the trigger event.

When the digital trigger condition of Card 1 occurs, Card 1 will internally generate the ADCONV signal and output this ADCONV signal to SSI\_ADCONV signal of Card 2, 3 and 4 through the SSI/PXI connectors. Thus we can achieve 16-channel acquisition simultaneously.

You could arbitrarily choose each of the 6 timing signals as the SSI master from any one of the cards. The SSI master can output the internal timing signals to the SSI slaves. With the SSI, users could achieve better card-to-card synchronization.

Note that when power-up or reset, the DAQ timing signals are reset to use the internal generated timing signals.

#### 4.6.4 AI\_Trig\_Out and AO\_Trig\_Out

AI\_Trig\_Out (or AO\_Trig\_Out) is the signal output following one of the four trigger sources (software trigger, analog trigger, digital trigger and SSI trigger) selected by the user. That is, AI\_Trig\_Out follows the A/D trigger source, and AO\_Trig\_Out follows the D/A trigger source. These two signals can be used to control external peripheral circuits or boards, or can be used as synchronization control signals. The signal level of the AI\_Trig\_Out and AO\_Trig\_Out are TTL-compatible.

---

**Note:** AI\_Trig\_Out and AO\_Trig\_Out are output pins on J5 (68-pin VHDCI). Connecting them to any signal source may cause permanent damage.

## Calibration

This chapter introduces the calibration process to minimize AD measurement errors and DA output errors.

---

### 5.1 Loading Calibration Constants

The DAQ/PXI-20XX is factory calibrated before shipment by writing the associated calibration constants of TrimDACs to the on-board EEPROM. TrimDACs are devices containing multiple DACs within a single package. TrimDACs do not have memory capability. That means the calibration constants do not retain their values after the system power is turned off. Loading calibration constants is the process of loading the values of TrimDACs stored in the on-board EEPROM. ADLINK provides software to make it easy to read the calibration constants automatically when necessary.

There is a dedicated space for calibration constants in the EEPROM. In addition to the default bank of factory calibration constants, there are three extra user-modifiable banks. This means users can load the TrimDACs values either from the original factory calibration or from a calibration that is subsequently performed.

Because of the fact that errors in measurements and outputs will vary with time and temperature, it is recommended re-calibration when the card is installed in the users environment. The auto-calibration function used to minimize errors will be introduced in the next sub-section.

---

## 5.2 Auto-calibration

By using the auto-calibration feature of the DAQ/PXI-20XX, the calibration software can measure and correct almost all the calibration errors without any external signal connections, reference voltages, or measurement devices.

The DAQ/PXI-20XX has an on-board calibration reference to ensure the accuracy of auto-calibration. The reference voltage is measured at the factory and adjusted through a digital potentiometer by using an ultra-precision calibrator. The impedance of the digital potentiometer is memorized after this adjustment. It is not recommended for users to adjust the on-board calibration reference except when an ultra-precision calibrator is available.

---

Note:

1. Before auto-calibration procedure starts, it is recommended to warm up the card for at least 15 minutes.
  2. Please remove the cable before an auto-calibration procedure is initiated because the DA outputs would be changed in the process of calibration.
- 

---

## 5.3 Saving Calibration Constants

After an auto-calibration is completed, users can save the new calibration constants into one of the three user-modifiable banks in the EEPROM. The date and the temperature when you ran the auto-calibration will be saved accompanied with the calibration constants. This means users can store three sets of calibration constants according to three different environments and re-load the calibration constants later.

# Warranty Policy

Thank you for choosing ADLINK. To understand your rights and enjoy all the after-sales services we offer, please read the following carefully.

1. Before using ADLINK's products, please read the user manual and follow the instructions exactly. When sending in damaged products for repair, please attach an RMA application form.
2. All ADLINK products come with a two-year guarantee, free of repair charge.
  - The warranty period starts from the product's shipment date from ADLINK's factory
  - Peripherals and third-party products not manufactured by ADLINK will be covered by the original manufacturers' warranty
  - End users requiring maintenance services should contact their local dealers. Local warranty conditions will depend on the local dealers
3. Our repair service does not cover the two-year warranty, if the following items cause damages:
  - a. Damage caused by not following instructions on user menus.
  - b. Damage caused by carelessness on the users' part during product transportation.
  - c. Damage caused by fire, earthquakes, floods, lightning, pollution and incorrect usage of voltage transformers.
  - d. Damage caused by unsuitable storage environments with high temperatures, high humidity or volatile chemicals.
  - e. Damage caused by leakage of battery fluid when changing batteries.
  - f. Damages from improper repair by unauthorized technicians.
  - g. Products with altered and damaged serial numbers are not entitled to our service.
  - h. Other categories not protected under our guarantees.
4. Customers are responsible for the fees regarding transportation of damaged products to our company or to the sales office.

5. To ensure the speed and quality of product repair, please download an RMA application form from our company website [www.adlinktech.com](http://www.adlinktech.com). Damaged products with RMA forms attached receive priority.

For further questions, please contact our FAE staff.
